1. Short Project Description

The aim of this project is to develop a programming game that allows users to develop their artificial intelligence agents and compete with other users. The game is a basic well-designed football simulation. Major audience for this project is anyone who is interested in A.I. or software development. We are going to provide an easy to use API for user interaction. Also, the process will be visualized in 2D manner.

2. Project Status

The list of completed tasks are following.

- General Class and Entity Design: The entities that will be used in the game such as "Team", "Player", and "Pitch" are decided. General game flow is designed.
- Modulation: The project is divided into three modules. These modules are the simulator, the visualizer and the A.I. agents.
- Visualizer: The basic 2D display of the simulation and the entities is completed.
- Data Communication: The communication between the simulator and the visualizer modules is implemented. This data that contains relevant information regarding the game entities is stored as a save file.
- GUI: A basic graphical user interface is implemented.
